

Inline Context

Every construct below puts a codespan somewhere that already has a slant or a weight of its own, so the reference says which of the two the page really draws.

Table 1. A caption is set in italic, and the codespan inside it is not

Action	Key
Delete the line	Ctrl+D
Insert code here	Ctrl+E

The style operators a column spec can carry, in a header column the renderer sets bold:

Operator	Meaning
d	Default paragraph text
m	Monospace

A paragraph carrying *emphasis around slanted text* and **strong around weighty text**, which is the other half of the rule: what the markup contributes travels into the fragment, and what the block sets around it does not.

A heading with nonbold in it

The closing paragraph, so the heading above is not the last thing on the page.
