

Math Parity

The quadratic formula, as a displayed LaTeX equation:

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

A summation, expressed in AsciiMath:

$$\sum_{i=1}^n i = \frac{n(n+1)}{2}$$

Mass-energy equivalence $E = mc^2$ reads inline, mid-sentence, without breaking the paragraph flow around it.

A verbatim listing must pass the math markup through untouched — here it is source text, not an equation:

```
render_math("stem:[a^2+b^2=c^2]")
render_math("latexmath:[\sqrt{n}]")
```
