Table of Contents

1. Headings and prose	2
1.1. Third-level heading	2
2. Lists	3
3. Tables	4
4. Figures	5
5. Columns	6
6. Admonitions	7
7. Quotations	8
8. Source code	9
9. Sidebars and examples	10
10. Text styles	11
Colophon	12

This document exists to show what your theme does. It uses every element a theme can style, so a change to almost any setting will visibly alter something on these pages.

Chapter 1. Headings and prose

Body text sets the measure everything else is judged against. This paragraph runs long enough to wrap several times, so that line height, text alignment and the page margins can be seen working together rather than in isolation. A theme that looks correct on a single line often does not.

1.1. Third-level heading

Text beneath a third-level heading. The spacing above and below a heading is as much a part of the theme as its size and colour.

1.1.1. Fourth-level heading

Deeper headings are rarer, but a theme still has to say something sensible about them.

Fifth-level heading

By this depth a heading is often no larger than the body text around it, so what distinguishes it is the weight, the colour and the space above it rather than the size.

Sixth-level heading

The deepest heading AsciiDoc offers, and the one a theme most often forgets: its default size is smaller than body text, not equal to it. A theme that leaves it undistinguished reads as a paragraph that lost its break.

Chapter 2. Lists

An unordered list:

- First item
- Second item, which is long enough to wrap and show how a continued list line is indented relative to its marker
- Third item
 - A nested item
 - Another nested item

An ordered list:

1. Prepare the document
2. Apply the theme
3. Read the result

A description list:

Theme

A YAML file describing how a document is rendered.

Preview

This document, rendered with that theme.

Chapter 3. Tables

Table 1. Quarterly totals

Region	Units	Share
Northern	1,204	41%
Southern	986	34%
Eastern	733	25%
Total	2,923	100%

A table with more columns than the measure comfortably holds is marked as wide. It reads normally here, and the large-table-page-size extension moves it onto a landscape page of its own.

Table 2. Regional detail by quarter

Region	Q1	Q2	Q3	Q4	Year
Northern	284	301	296	323	1,204
Southern	240	248	244	254	986
Eastern	179	184	181	189	733

Table 3. Units by channel

Channel	Units	Share
Direct	1,608	55%
Partner	877	30%
Retail	438	15%

Chapter 4. Figures

A captioned figure is styled by its own caption settings, and its alignment and border are separate theme settings again.

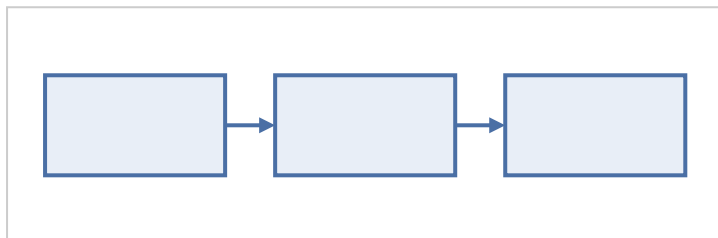

Figure 1. A three-stage process

Several figures show how consecutive captions sit against one another, and give the list of figures enough entries to judge its own line spacing by.

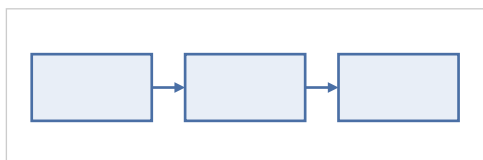

Figure 2. The same process at a smaller scale

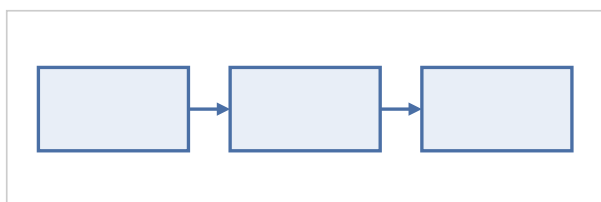

Figure 3. A deliberately long caption, because a caption that wraps onto a second line in the list of figures is where an entry and its page number are most likely to drift out of alignment

Chapter 5. Columns

Prose at the full measure of the page, so that a region set in columns is visibly narrower than the text around it rather than merely being different.

A region marked for columns reads as ordinary prose until the multi-column-sections extension is enabled, at which point it is laid out in two columns while the surrounding text keeps the full measure. Reference material — a glossary, a long enumeration, a table of symbols — is what this is for, because a narrow measure suits short entries and wastes space on long paragraphs.

The region runs on for several paragraphs precisely so that the column boundary is somewhere a reader can see it, rather than being inferred from a single line of text that happens to stop early. A boundary you can point at is what makes the column gap and the column width worth judging.

Several numbered paragraphs are set here rather than one because paragraph numbering places its numbers per column: the leftmost column takes them in the left page margin, the rightmost in the right margin. One number can only ever demonstrate half of that rule, and it is the half that looks the same as ordinary marginal numbering at the full measure.

Where a column is interior — which a three-column region has and this one does not — the only room left for a number is the gutter, and that is usually too narrow to hold one. Those paragraphs number inline instead, so the fallback is visible beside the margin placement rather than only described.

A region this long is deliberate. The numbers on the first column prove only that a number can sit in the left page margin, which is what marginal numbering does at the full measure too; the rule worth seeing is the one that sends the rightmost column's numbers the other way.

So the text continues past the point where the columns divide. Everything from here begins inside the second column, and each of these paragraphs takes its number in the RIGHT page margin — outward, away from the gutter, mirroring the first column rather than repeating it.

Read the two columns together and the arrangement is legible at a glance: numbers down the outside edges, nothing in the gutter between them, and the prose keeping a straight measure on both sides because a marginal number is drawn outside the text rather than inserted into it.

That is the whole of the placement rule for two columns. A three-column region adds one more case, the interior column, whose numbers fall back inline because a gutter cannot hold them.

Full-measure prose resumes after the region.

Chapter 6. Admonitions

An informational aside. Admonition padding, label styling and the rule beside it are all theme settings.

A suggestion the reader can act on.

Something that could go wrong.

Proceed carefully.

Do not skip this.

Chapter 7. Quotations

The Analytical Engine has no pretensions whatever to originate anything. It can do whatever we know how to order it to perform.

— Ada Lovelace, Notes on the Analytical Engine

Tell all the truth but tell it slant —
Success in Circuit lies

— Emily Dickinson

Chapter 8. Source code

A source block, with callouts:

```
require 'asciidoctor-pdf' ①

Asciidoctor.convert_file 'document.adoc',
  backend: 'pdf',           ②
  attributes: { 'pdf-theme' => 'my-theme' } ③
```

- ① Loads the converter.
- ② Selects the PDF backend.
- ③ Applies this theme.

Inline `monospaced text` is styled separately from a source block.

Chapter 9. Sidebars and examples

A sidebar

Sidebars carry material that supports the main text without interrupting it. Their background, border and padding are all theme settings.

Example 1. An example block

Example blocks are styled independently of sidebars, and often differently.

Chapter 10. Text styles

Bold, *italic*, `monospace`, highlighted, underlined and ~~struck through~~ text. A larger and a smaller run. A footnote sits at the foot of its page.^[1]

A link to [the AsciiDoctor site](#) shows the link colour.

A thematic break sits above this line.

[1] Footnotes are styled by their own theme settings.

Colophon

This sample was set in the theme's own body font. The colophon-placement extension moves a section marked this way to the back of the book and leaves it out of the contents list.
